Expectations

- A reusable component/library-style reusable module
- Written in Python
- Provides documentation
- Taken care of missing parts

What’s missing to be taken care before design?

- Authentication
  - We assume its API Key based Authentication
    - As each user has role/authorization
- API responses statuses
  - Currently API specification shows 200 status
  - We assume the backend sends status of:
    - 200 -> Success
    - 401 -> Authentication error
    - 403 -> Permission denied
    - 404 -> Not found
    - 429 -> Rate limit
    - 500 -> Server error
  - Taken care no connection/DNS connectivity, response timeout (client side)

Design

- Inspired by the modern standard LLM Providers SDKs

```python
config = ChatbotConfig(
    base_url="https://chatbot-dev.example.com",
    auth=BearerTokenAuth("auth-token"),
    timeout=...
    connect_timeout=...
    max_retries=...
    ...)

with ChatbotClient(config) as client:
    chat = client.create_chat("bot-id")
    print(chat.send("What can you help me with?"))
```

```python
// export CHATBOT_BASE_URL="https://chatbot-dev.example.com"
// export CHATBOT_API_TOKEN="auth-token"

config = ChatbotConfig.from_env()

with ChatbotClient(config) as client:
    chat = client.create_chat("bot-id")
    print(chat.send("What can you help me with?"))
```
